

Discussion:

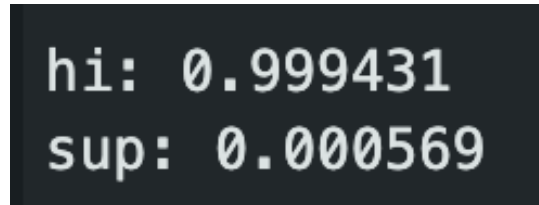

The model was missing an input layer. I noticed that `inputs.shape` was (100, 714) which meant that each sample had 714 features. I added `model.add(tf.keras.layers.Input(shape=(714,)))` before the Dense layers in the model.

This model is a classification model. I changed the compile settings for the model to

```
model.compile(optimizer='adam', loss='categorical_crossentropy', metrics=['accuracy'])
```

Also, I changed the title of the third plot to "Training and Validation accuracy After Initial Epochs" since the plot skipped the first 50 epochs.

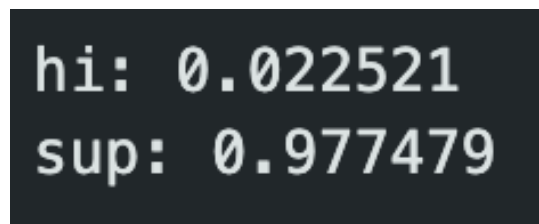

Screenshots:

```
hi: 0.999431
sup: 0.000569
```

A screenshot of a terminal window with a black background and white text. It displays two lines of output: 'hi: 0.999431' and 'sup: 0.000569'.
